Characteristics and typical fields of application						
<p>Austenitic stainless steel CrNiMo rutile flux-cored wire of T 23 12 2 L R / E309LMoT0 type for welding and cladding preferably in flat and horizontal position. The corrosion resistance is superior to E316L type fillers. Primarily designed for welding dissimilar joints between stainless steels and low-alloyed steels. It can also be used for overlay welding, providing an 18Cr-8Ni-2Mo deposit from the very first layer and for joining of various steels. The wire offers high safety against hot cracking even at high dilution. Alloying with molybdenum increases the corrosion resistance and weld metal strength. Easy handling and high deposition rate result in high productivity with excellent welding performance, very low spatter formation and a smooth surface. Increased travel speeds as well as self-releasing slag with little demand for cleaning and pickling provide considerable savings in time and money. The wide arc ensures even penetration and side-wall fusion to prevent lack of fusion. Suitable for service temperatures from -60°C to 300°C. VENVU 309 Mol Ø 1.2 mm can be used for a wall thickness ≥ 3 mm. For welding in vertical-up and overhead positions, VENVU A 309 Mol should be preferred.</p>

# VENVU 309 MoI

Flux-cored wire, high-alloyed, special applications

## Operating data

	Ø (mm)	Wire feed m/min	Arc length mm	Current A	Voltage V
	1.2	5.0 – 15.0	~ 3	130 – 280	22 – 30
	1.6	4.5 – 9.5	~ 3	200 – 350	25 – 30

Welding with standard GMAW power source with DC+ polarity. No pulsing needed. Backhand (drag) technique preferred with a work angle of appr. 80°. Ar + 15 – 25% CO<sub>2</sub> as shielding gas offers the best weldability. 100% CO<sub>2</sub> can be also used, but the voltage should be increased by 2 V. The gas flow should be 15 – 18 l/min and the wire stick-out 15 – 20 mm. The heat input should not exceed 2.0 kJ/mm. For dissimilar welding, slight weaving is recommended for all welding positions. Preheat and interpass temperatures as required by the base metal. Post-weld heat treatment generally not needed. For constructions that include dissimilar welding of low-alloyed steels, a stress-relieving annealing stage may be advisable. Always consult the supplier of the parent material or seek other expert advice to ensure that the correct heat treatment process is carried out. Re-drying of the wire possible at 150°C for 24 h if necessary. Ferrite measured with Fischer Feritescope 15 – 23 FN.
